Notes
1 Continuous Power Rating (Pc).
Pc = \frac{V^2}{R}

V is the RMS voltage which can be applied to the unit continuously without thermal overload of the voice coil. At low frequencies the continuous power rating of the speaker may be reduced because of limitations imposed on diaphragm excursion by the acoustic loading.

2 The programme rating of a unit is equal to the maximum programme rating of any system with which the unit may be safely used in conjunction with the recommended dividing network and enclosure.

3 The programme rating of any system is the undistorted power output of an amplifier with which the system may be satisfactorily operated on normal programme over an extended period of time.

4 "Typical production spread" is derived from statistical analysis of a large number of units, and is calculated to include 95% of all units.

\[ Q_m = \frac{2πf_s M_D}{R_{MS}} \]
\[ Q_e = \frac{2πf_s M_D}{(BL)/R_{DC}} \]
\[ Q_L = \frac{1}{Q_M} + \frac{1}{Q_E} \]
